

Overview - How an Order Flows Through the System

Who this is for: everyone testing. A plain-language map of how a job travels from a quote in HQ out to the Shop Floor, Finishing Floor, and Pick/Pack, and back to NetSuite. Use it to understand where your screen fits in the whole.

Status note for testers: the **inside of each app works**; the **handoffs between apps** are what's actively being finished. Where a connection is still being wired, it's flagged [**being connected**] so you know what to test now vs. what's coming.

The big picture

The thread that ties it together is the **order identity** - a job's quote, and the Sales Order it becomes - carried onto both the shop and finishing work orders so the two halves stay matched. [**being connected**]

Stage 1 - Design & catalog (HQ)

A product is built up the front-office tabs: **Inception** (sketch -> 3D model -> approvals) -> **Node Grouping** (tag the model's parts) -> **Visual Assembly** (pin the sub-parts) -> **BOM Engine** (enter data, costs, prices) -> **Master Library** (the finished catalog item). See **SOP 1** for the main-assembly + CPQ setup.

Stage 2 - Quote (CPQ)

Sales configures and prices a job two ways, both ending in a quote:

- **Vision Hardware (Tab 9)** for measured drapery-hardware jobs (see **SOP 2**), which pushes lines into...
- **CPQ Configurator (Tab 8)**, where each line is configured in 3D, priced (including customer-specific pricing), and added to a quote cart.

Finalizing pushes the quote to NetSuite as an **Estimate** today. The plan: when NetSuite returns a **confirmed Sales Order**, it's imported and reconciled back to the originating quote, which then **auto-creates the work orders**. [**being connected**]

Stage 3 - Dispatch (RTG, Tab 13)

RTG Dispatch is the control center. It takes a confirmed order and splits it into two streams:

- **Custom parts -> Shop Floor** (things fabricated to size: cut poles, custom brackets).
- **Small parts -> Finishing Floor** (catalog parts that get picked and finished).

Today this is a manual push per order; the automatic split + the shared order key that keeps both halves matched is what's being wired. [**being connected**]

Stage 4 - Shop Floor (custom fabrication)

Custom jobs land in the Shop Floor's **Custom** queue, flow through **Milling -> Scheduler**, get produced against their **routings & programs**, and are marked complete. Operators can pull a part's **program print** from the central Asset Gallery via the new **Print** button (see the prints feature). Stock-replenishment work orders (to keep small parts on the shelf) also originate here from the inventory view.

Stage 5 - Finishing Floor (small parts)

Small-parts work orders arrive in the **Setup Queue**, then move to the **Active Floor**, which schedules the spray/bake/hand steps. The job window is meant to show the matching **custom-parts status** (so finishing can see when the shop side is done) - that cross-floor status mirror is [**being connected**]. Recipes + the asset gallery show finishers exactly what to do.

Stage 6 - Pick / Pack

Once a finishing manager releases a job, **Pick/Pack** picks the small parts (bin-by-bin), stages them with a barcoded label, and **scans to match** them with the custom parts coming off the Shop Floor. Matched orders move to finishing as "Set Up," then - after finishing - return to Pick/Pack to be **packed, labeled, shipped**, and pushed back to NetSuite as **fulfilled**. The queue-feeding, staging match, and pack/fulfill close-out are [**being connected**].

Cross-cutting tools

- **Asset Gallery + Print buttons** - one central place for finish swatches, reference images, and now **program prints** (PDFs/drawings), retrievable anywhere by the program/item name.
 - **NetSuite** - the system of record for accounting; the app pushes prices, costs, and fulfillment to it. The goal is for staff to work in these friendlier screens while NetSuite stays the back-end ledger.
 - **Login** - every app uses the same PIN login; admin and superadmin see all tabs.
-

What to test now vs. what's coming

Test now (works inside each app): building a main assembly + CPQ flow (SOP 1); running Vision -> CPQ to produce a priced quote (SOP 2); navigating each floor app and its tabs; the Asset Gallery + Print buttons.

Coming / [being connected]: the automatic SO import + order split, the shared key that keeps shop & finishing halves matched, the finishing->pick/pack release + staging scan, and the pack/ship/fulfill close-out. If a handoff *between* apps doesn't carry data yet, that's expected - note it, but it's on the build list, not a surprise.
